

Lab 5.8.6.1 Structures

Objectives

Familiarize the student with:

- Structures
- Printing on screen

Scenario

Write a program that creates the first names and last names of 4 people and then prints them. Create the appropriate structure. Then create one variable for each person, initialize their values with a constant value (from the code - don't interact with the user this time). Finally, print each of them on a separate line. Your version of the program must print the same result as the expected output.

```
#include <stdio.h>

int main()
{
    /* your code */
    return 0;
}
```

Example output

```
Mary Smith
James Johnson
Patricia Williams
John Brown
```
