

Lab 4.1.4.1 Switch: part 1

Objectives

Familiarize the student with:

- Working with the *switch-case* statement
- Printing on screen

Scenario

Write a program that asks for the number of a month from the user and prints the name of that month on the screen. When the number does not correspond to a month (less than 1 or greater than 12), the program prints: "Error: no such month in my calendar." If you can't remember all the names (and of course to speed up your programming), here is a list:

- 1 : January
- 2 : February
- 3 : March
- 4 : April
- 5 : May
- 6 : June
- 7 : July
- 8 : August
- 9 : September
- 10 : October
- 11 : November
- 12 : December

Your version of the program must print the same result as the expected output.

```
#include <stdio.h>

int main()
{
    /* your code */
    return 0;
}
```

Example input

12

Example output

December

Example input

2

Example output

February

Example input

15

Example output

```
Error: no such month in my calendar.
```
